

'viewCourses()': Uses the 'enrolledCourse' list to get and return the corresponding 'Course' objects associated with each 'CourseSection'.

The lists (students, advisors, courses, and courseSections) should be initialized as empty in the constructor.

The methods 'enrollCourse(courseSection: CourseSection)' and 'dropCourse(courseSection: CourseSection)' in the Student class are responsible for managing the 'enrolledCourses' list.

The same applies to the 'assignedStudents' and 'awaitingStudents' lists in the Advisor class.
